Preface	9
I. Classical Approach for Describing Physical Systems	13
1. The System Concept of Classical Mechanics	15
1.1. Phenomenology of Classical Mechanics	15
1.2. The Hamilton Principle for Isolated Systems	18
1.3. The Hamilton Principle for Systems Under External Influence	20
2. More Abstract Description of Classical Mechanics	25
2.1. The Legendre Transformation	25
2.2. The Legendre Transform of the Lagrangian: the Hamiltonian and the Canonical Equations of Motion of the Isolated System	26
2.3. Geometric Interpretation of the Canonical Equations	27
2.4. Canonical Transformations	28
2.5. The Symplectic Group and the Lie Groups	30
2.6. General Properties of the Isolated, Conservative Classical Mechanical Systems	36
3. Statistical Description in Classical Mechanics	41
3.1. The Concept of Independent Subsystems	42
3.2. The Lagrangian Multipliers and Reduced Gradient	46
3.3. The Adjoint Task	48
3.4. Boltzmann's Entropy and the "Entropy Maximum Principle"	49

6	<i>Contents</i>	
3.5.	Monotone Dependence of the Entropy on the Internal Energy	51
3.6.	The Energy Minimum Principle and Its Relationship with the Entropy Maximum Principle	53
4.	Axiomatic Formulation and Application of Classical Thermodynamics	55
4.1.	Application of the Energy Minimum Principle	56
5.	Further Minimum Principles	59
5.1.	Thermal Equilibrium in Chemical Reactions	61
5.2.	Heat of Reaction: Exotherm and Endotherm Chemical Reactions	62
6.	Processes Far from the State of Thermal Equilibrium	65
6.1.	The Brusselator	66
6.2.	The FKN Model of the Belousov-Zhabotinsky Reaction	75
II.	Classical Control of Physical Systems	87
7.	Introduction: Historical Antecedents	89
8.	Control of Continuous Linear Systems of Constant Parameters	91
8.1.	Some Practically Useful Basic Knowledge in Linear Algebra	92
8.2.	The Gram-Schmidt Algorithm (QR Decomposition)	97
8.3.	Simple SCILAB Code Realizing the Gram-Schmidt Algorithm	98
8.4.	Schur's Decomposition of Complex Matrices	103
8.5.	Block Diagonal Form, Generalized Eigenvectors, Jordan's Canonical Form	107
8.6.	A Simple SCILAB Aid for Finding the Jordan Canonical Form	109
8.7.	Illustrative Examples	111
8.8.	The Exponential Function of Jordan's Canonical Form and Upper Triangular Forms with Identical Main Diagonals	122
8.9.	The Cayley-Hamilton Theorem	123
8.10.	Controllability of the Continuous Linear System of Constant Parameters	124
8.11.	Observability of Continuous Linear Systems of Constant Parameters	126
8.12.	Least Squares Based Practical State Estimation for Continuous Time Constant Parameter Systems	129

8.13. Discrete Time Approximation of Linear Systems of Constant Coefficients	131
8.14. The Use of Laplace Transform for Linear Systems of Constant Coefficients: The Resolvent	134
8.15. Basics for the Calculation of Laplace and Fourier Transforms in Engineering Applications	137
8.16. The Fourier Transform of Real Functions	141
8.17. The Function Class \mathcal{D} and the Distributions	141
8.18. The Derivatives of the Regular and Irregular Distributions	144
8.19. Sequences and Derivatives of Sequences of Regular Distributions	145
8.20. The Fourier Transform of Distributions: Analytical Functionals or Ultradistributions: the Function Class \mathcal{L}	145
8.21. A Typical Consequence of Linear Approximations: the Cramers-Krönig Relations	147
8.22. Control Methods for LTI Systems: Full State Feedback by Pole Placement	148
9. Examples for Nonlinear Systems	151
9.1. The van der Pol Oscillator	151
9.2. The Duffing Oscillator	157
9.3. The Lorenz System	161
9.4. Rössler's System	163
9.5. Chaotic Motion and "Strange Attractors" of Nonlinear Systems, Poincaré Maps	172
9.6. The Fixed Points of the Logistic Function	173
9.7. Bifurcations and Symmetry Breaking	176
9.8. The Hodgkin-Huxley and the Fitz-Hugh-Nagumo Neuron Models	179
9.9. The Chua-Matsumoto Circuit	180
9.10. Hydrodynamic Traffic Flow Models	182
9.11. Financial System Models	202
10. Control Methods for Nonlinear Systems	207
10.1. Model Based Optimal Control	207
10.2. Simple Receding Horizon Controller	210
10.3. The Linear Quadratic Regulator (LQR) for the Control of Linear Time-Invariant Systems	212
10.4. Robust Variable Structure/Sliding Mode (VS/SM) Controllers	216
10.5. Lyapunov's 2 nd Method: Barbalat's Lemma and the Functions of Class κ	218

8 *Contents*

10.6. The Adaptive Inverse Dynamics Controller of Robots	224
10.7. The Model Reference Adaptive Controllers	235
10.8. The Adaptive Controller Using “Robust Fixed Point Transformations”	242
10.9. The Use of the RFPT-based Adaptive Control in the Implementation of MRAC	269
Appendices	303
A – List of Simulation Programs	303
List of figures	307
References	323
Index	331
